Labor Information	76% of the electricity assigned to this electricity product came from power sources with union contract with their employees.																																																																										

Renewable credits and/or alternative compliance purchased based on Massachusetts Renewable Portfolio Standard requirements.

Notes: 1. See reverse side and your contract terms and conditions for further information on this label. You may also call Dominion at 1(888)284-3558, or the Massachusetts Division of Energy Resources at 1(800) 392-6066.
 2. Dominion Retail, Inc. projects that its customers will be served electricity entirely from the New England integrated power supply (not any one particular generation unit), customers will be updated quarterly via the dom.com web site.

LABEL DESCRIPTION

Generation Price and Contract:

For Generation Prices and contract items refer to your specific contract/offer for generation service. See your recent bills to determine average monthly use, and your Terms of Service for additional information.

Power Sources:

The electricity that you consume comes from the New England power grid which receives power from a variety of power plants and transmits the power throughout the region as needed to meet the requirements of all customers in New England. When you choose a power supplier, that supplier is responsible for generation and/or purchasing power that is added to the power grid in an amount equivalent to your electricity use. **Known Resources** include resources that are owned by, or under contract to, the supplier. **System Power** represents power purchased in the regional electricity market. **Biomass** refers to power plants that are fueled by wood or other plant matter. **Hydro** resources of greater than 30 megawatts in size are deemed "large hydro." All other hydro resources are deemed "small hydro." Other Renewables include fuel cells utilizing renewable fuel sources, landfill gas and ocean thermal.

Emissions:

Emissions for each of the following pollutants are presented as a percent of the regional average emission rate. Dots represent, for each pollutant, the emission rate from a hypothetical new generation facility.

Carbon Dioxide (CO₂) is released when fossil fuels (e.g. coal, oil and natural gas) are burned. Carbon Dioxide, a greenhouse gas, is a major contributor to global warming.

Nitrogen Oxide (NO_x) forms when fossil fuels and Biomass are burned at high temperatures. It contributes to acid rain and ground-level ozone (or smog), and may cause respiratory illness in children with frequent high level exposure. NO_x also contributes to oxygen deprivation of lakes and coastal waters which is destructive to fish and other animal life.

Sulfur Dioxide (SO₂) is formed when fuels containing sulfur are burned, primarily coal and oil. Major health effects associated with SO₂ include asthma, respiratory illness and aggravation of existing cardiovascular disease. SO₂ combines with water and oxygen in the atmosphere to form acid rain, which raises the acid level of lakes and streams and accelerates the decay of buildings and monuments.

Labor Data:

The information on this label regarding whether generators or suppliers operate under collective bargaining agreements is provided to inform you about whether or not the energy was produced in plants where employee wages and working conditions are mutually determined by employees and management, and protected by union contracts. The information on this label regarding the use of replacement employees during a labor dispute is provided to inform you of whether or not a generator or a supplier during a strike or by lock-out of its employees has replaced them with other workers.
